Luethi E., Jasmat N.B., Grayling R.A., Love D.R., Bergquist P.L.;

"Cloning, sequence analysis, and expression in Escherichia coli of a

gene coding for a beta-mannanse from the extremely thermophilic

bacterium 'Caldocellum saccharolyticum'.";

Appl. Environ. Microbiol. 57:694-700(1991)

-i-FUNCTION: DEGRADATION OF HEMICELLICOSES, THE SECOND MOST ABUNDANT

POLYSACCHARIDES IN NATURE. CONTAINS TWO CATALYTIC DOMAINS WITH

MANNANASE AND ENDOGLUCANASE ACTIVITIES.

-i- CATALYTIC ACTIVITY: Random hydrolysis of 1,4-beta-D-mannosidic

linkages in mannans, galactomannans, glucomannans, and

SIMILARITY: IN THE C-TERMINAL SECTION, BELONGS TO CELLULASE FAMILY J (FAMILY 44 OF GLYCOSYL HYDROLASES).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    galactoglucomannans.
CATALYTIC ACTIVITY: Endohydrolysis of 1,4-beta-D-glucosidic
linkages in cellulose.
MISCELLANEOUS: THIS ENZYME IS MOST ACTIVE AT PH 6 AND 80 DE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Microbiol. 58:3864-3867(1992).

SUBMILTED (FEB-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: TRANSCRIPTIONAL REPRESSOR OF GENES THAT REQUIRE
PROTEIN FOR THEIR TRANSCRIPTION. MAY ACT AS A NEGATIVE REG
OF MYOGENESIS BY INHIBITING THE FUNCTIONS OF MYOD AND ASH1
SIMILARITY).
-!- SUBUNIT: TRANSCRIPTION REPRESSION REQUIRES FORMATION OF A
WITH A CO-REPRESSOR PROTEIN (GROUCHO) (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Nuclear.

J. Cell Sci. 108:1093-1103(1995).

-i- function: myoSin Is a protein that binds to actin & has atpase activity that is activited by actin.

-i- Subunit: myoSin I heavy charles single-headed. Dimer of a heavy and a light chain. Imability to self-assemble into filaments.

-i- Similarity: Contains 1 myoSin-like globular head domain.

-i- Similarity: Contains 1 sh3 domain.

FOR A TIGHT INTERACTION WITH THE EXTRACELLULAR MATRIX (BY FOR: THE PRECURSOR IS CLEAVED BY A FURIN ENDOPEPTIDASE.

PTM: IS SUBJECTED TO AN INTERACELLULAR MATURATION PROCESS LEADIND TO A FRACMENT CONTAINING THE N-TERMINAL REGION INCLUDING THE METALLOPROTEINASE DISINTEGRIN-LIKE, CYS-RICH AND TS-1 DOMAINS AND THE C-TERMINAL FRAGMENT CONTAINING THE SPACER 2 AND THE FOUR TS-1 DOMAINS.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY M12B.

SIMILARITY: CONTAINS 8 TSP TYPE-1 DOMAINS.
